## Tree Data Structure

In this tutorial, you will learn about tree data structure. Also, you will learn about different types of trees and the terminologies used in tree.

A tree is a nonlinear hierarchical data structure that consists of nodes connected by edges.

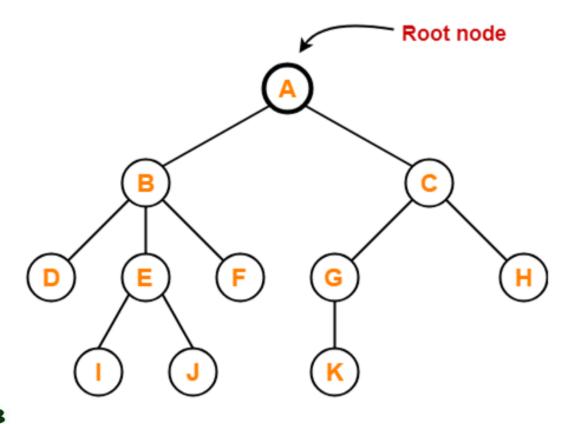

#### Root

The first node from where the tree originates is called as a **root node**.

In any tree, there must be only one root node.

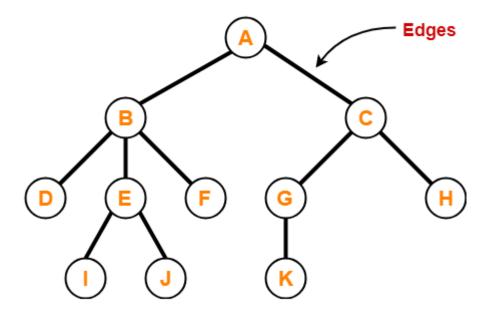

We can never have multiple root nodes in a tree data structure.

Here, node A is the only root node.

## Edge

The connecting link between any two nodes is called as an **edge**.

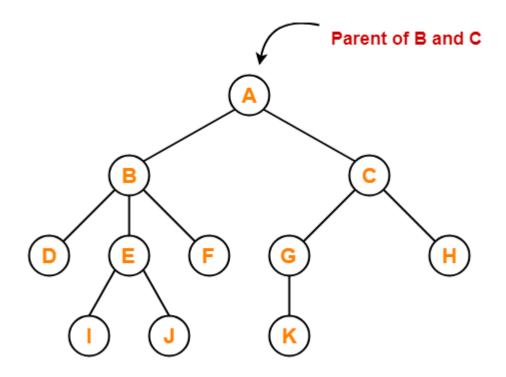

#### **Parent**

The node which has a branch from it to any other node is called as a **parent node**.

In other words, the node which has one or more children is called as a parent node.

In a tree, a parent node can have any number of child nodes.

- Node A is the parent of nodes B and C
- Node B is the parent of nodes D, E and F
- Node C is the parent of nodes G and H
- Node E is the parent of nodes I and J
- Node G is the parent of node K

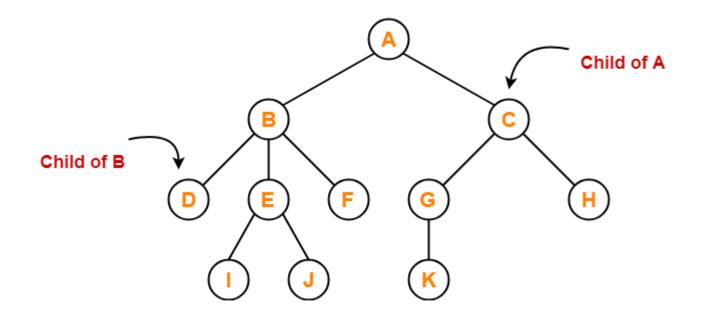

#### **Child**

The node which is a descendant of some node is called as a **child node**.

All the nodes except root node are child nodes.

- Nodes B and C are the children of node A
- Nodes D, E and F are the children of node B
- Nodes G and H are the children of node C
- Nodes I and J are the children of node E
- Node K is the child of node G

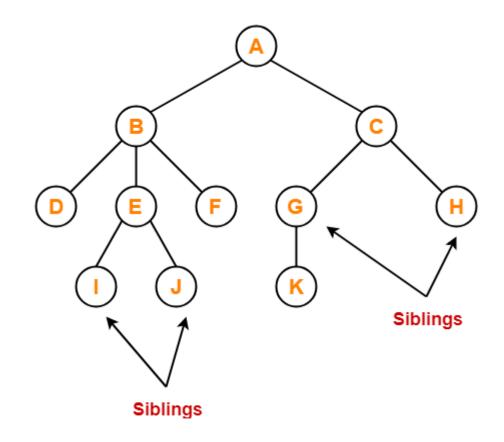

### **Siblings**

Nodes which belong to the same parent are called as **siblings**.

In other words, nodes with the same parent are sibling nodes.

- Nodes B and C are siblings
- Nodes D, E and F are siblings
- Nodes G and H are siblings
- Nodes I and J are siblings

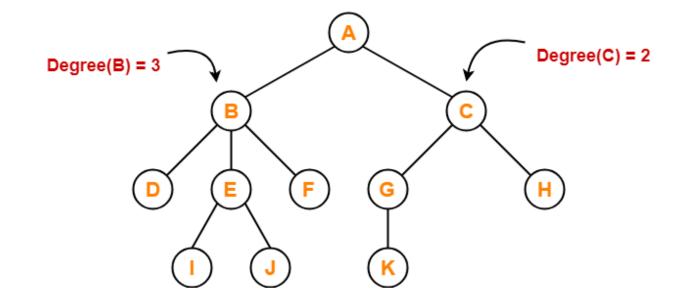

#### Degree

**Degree of a node** is the total number of children of that node.

**Degree of a tree** is the highest degree of a node among all the nodes in the tree.

- Degree of node A = 2
- Degree of node B = 3
- Degree of node C = 2
- Degree of node D = 0
- Degree of node E = 2
- Degree of node F = 0
- Degree of node G = 1
- Degree of node H = 0
- Degree of node I = 0
- Degree of node J = 0
- Degree of node K = 0

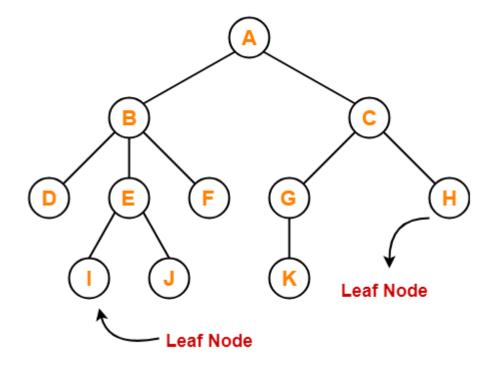

#### **Leaf Node**

The node which does not have any child is called as a **leaf node**.

Leaf nodes are also called as **external nodes** or **terminal nodes**.

Here, nodes D, I, J, F, K and H are leaf nodes.

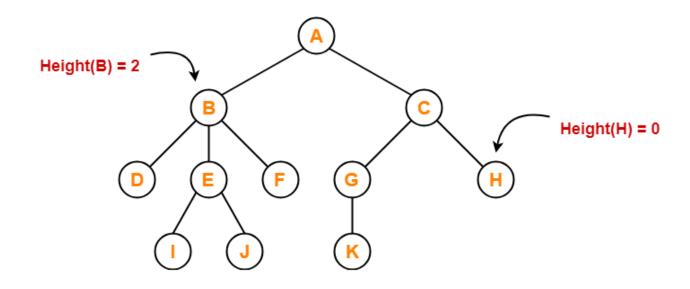

#### Height

Total number of edges that lies on the longest path from any leaf node to a particular node is called as **height of that node**.

**Height of a tree** is the height of root node.

- Height of all leaf nodes = 0
- Height of node A = 3
- Height of node B = 2
- Height of node C = 2
- Height of node D = 0
- Height of node E = 1
- Height of node F = 0
- Height of node G = 1
- Height of node H = 0
- Height of node I = 0
- Height of node J = 0
- Height of node K = 0

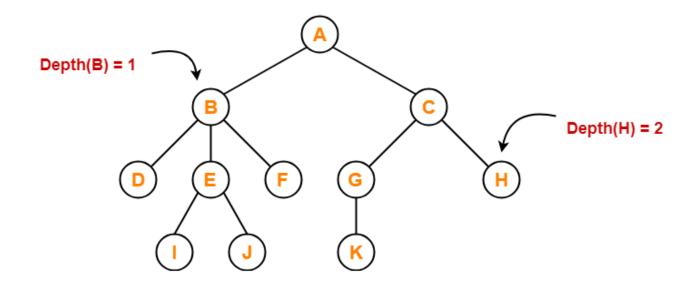

#### Depth

Total number of edges from root node to a particular node is called as **depth of that node**.

Depth of the root node = 0

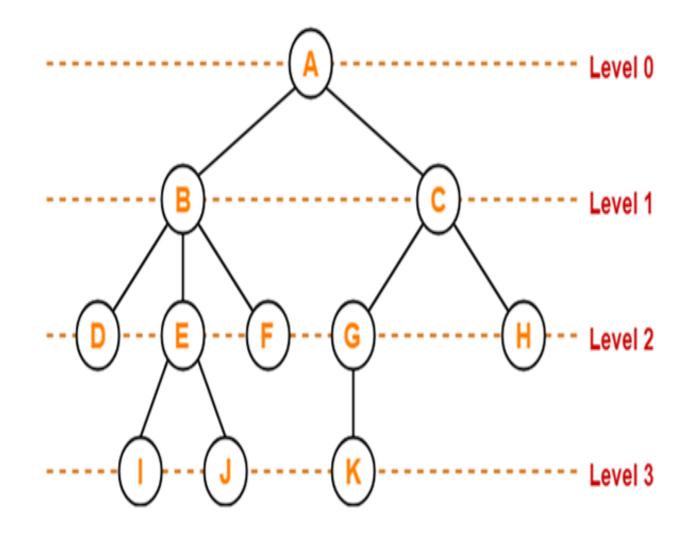

- Depth of node A = 0
- Depth of node B = 1
- Depth of node C = 1
- Depth of node D = 2
- Depth of node E = 2
- Depth of node F = 2
- Depth of node G = 2
- Depth of node H = 2
- Depth of node I = 3
- Depth of node J = 3
- Depth of node K = 3

#### Level

In a tree, each step from top to bottom is called as **level of a tree**.

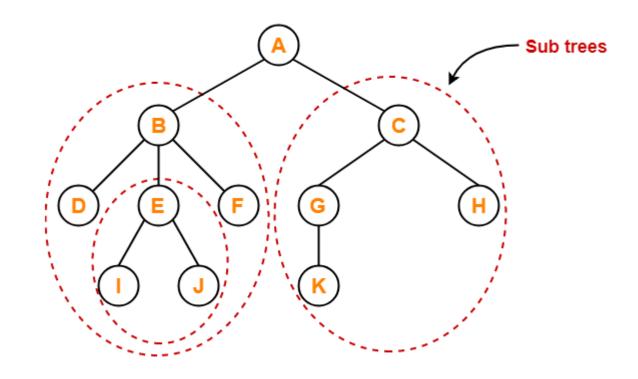

The level count starts with 0 and increments by 1 at each level or step

#### **Subtree**

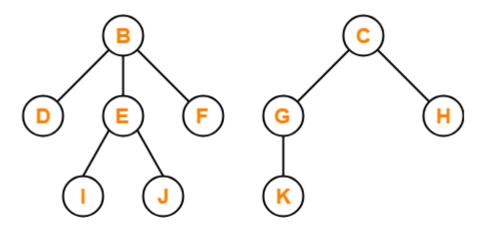

In a tree, each child from a node forms a **subtree** recursively.

Every child node forms a subtree on its parent node.

#### **Forest**

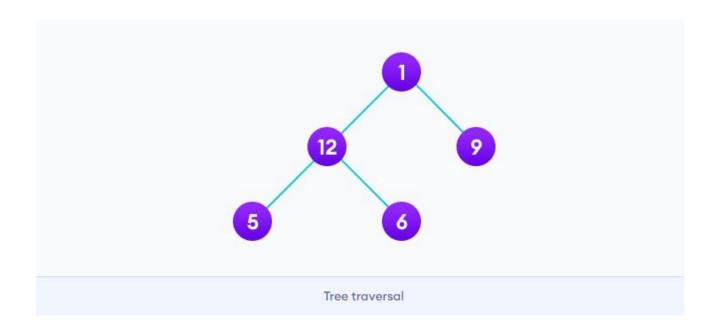

A forest is a set of disjoint trees.

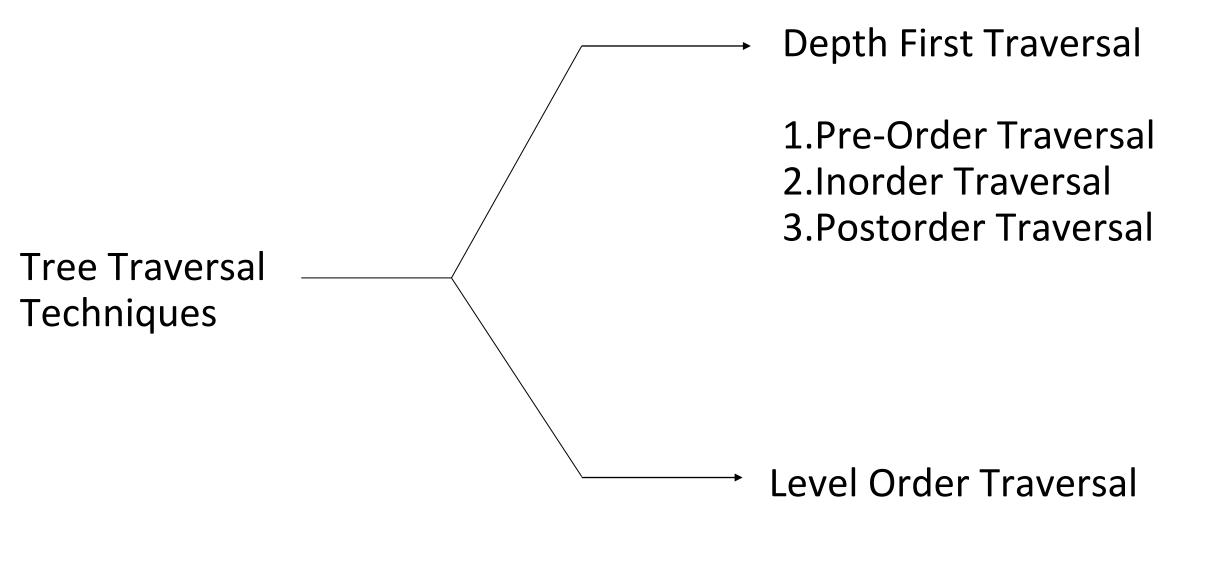

Forest

#### **Tree Traversal**

Tree traversal refers to the process of visiting each node in a tree data structure.

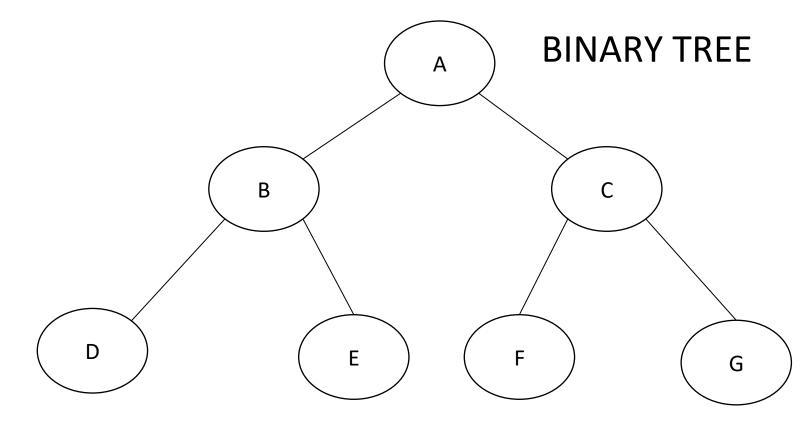

#### **Pre-Order Traversal**

- Visit The root
- Traverse the left subtree
- Traverse the right subtree

**REMEMBER:** 

ROOT-LEFT-RIGHT

Pre-Order Traversal: A B DE C F G

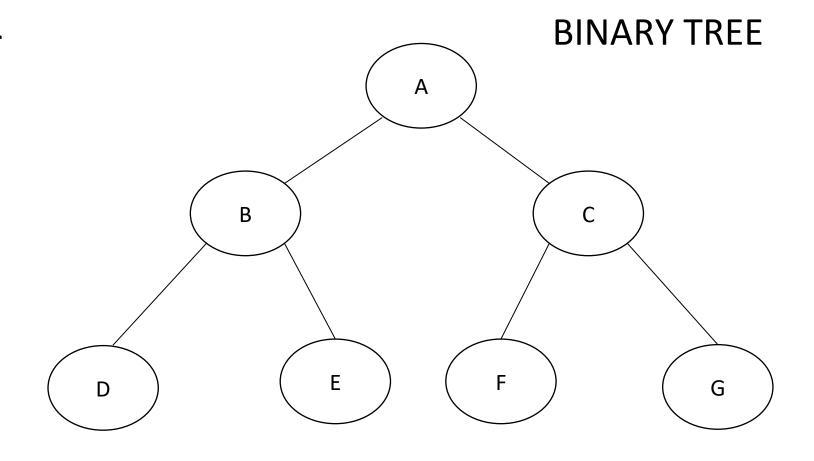

# Shortcut For Pre-Order Traversal

#### **Pre-Order Traversal**

Just traverse the entire tree starting from the root node keeping yourself to the left

**REMEMBER:** 

**ROOT-LEFT-RIGHT** 

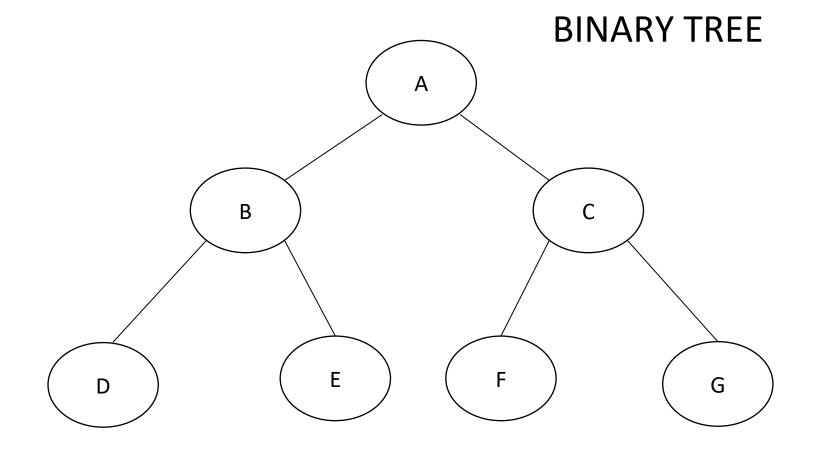

Pre-Order Traversal: A B DE C F G

#### **In-Order Traversal**

- Traverse the left subtree
- Visit the root
- Traverse the right subtree

**REMEMBER:** 

**LEFT-ROOT RIGHT** 

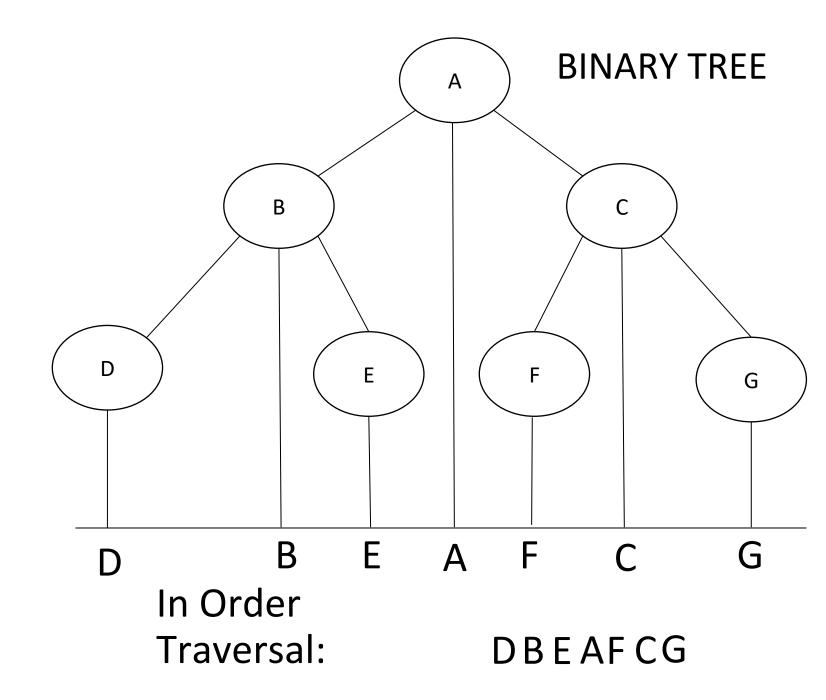

Pre-Order Traversal: DBEAFCG

# Shortcut For In Order Traversal

#### In Order Traversal

Just keep a plane mirror horizontally at the bottom of the tree and take the projection of all nodes.

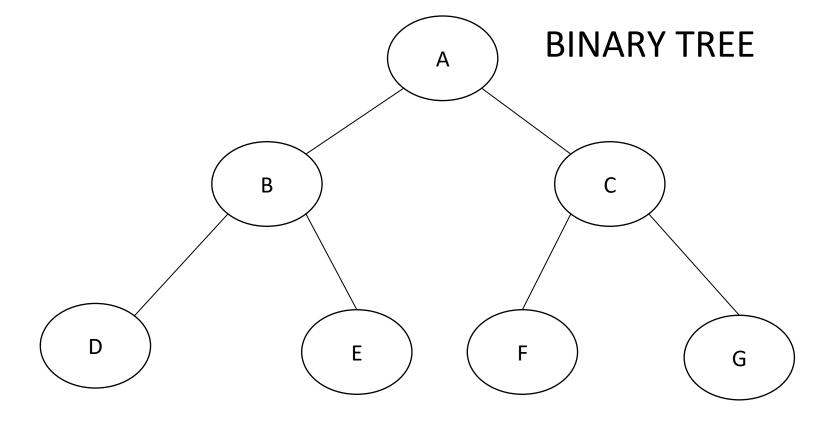

#### **Post-Order Traversal**

- Traverse the left subtree
- Traverse the right subtree
- Visit the root

**REMEMBER:** 

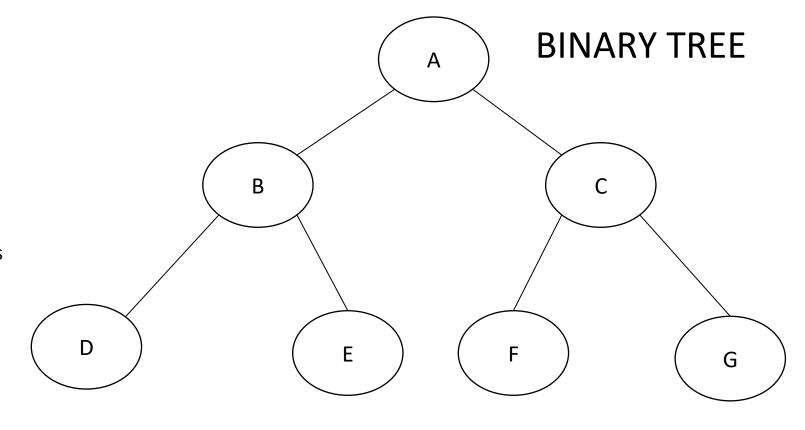

LEFT-RIGHT-ROOT

Post-Order TraversalDE BFG CA

## Shortcut For In Order Traversal Post-Order Traversal

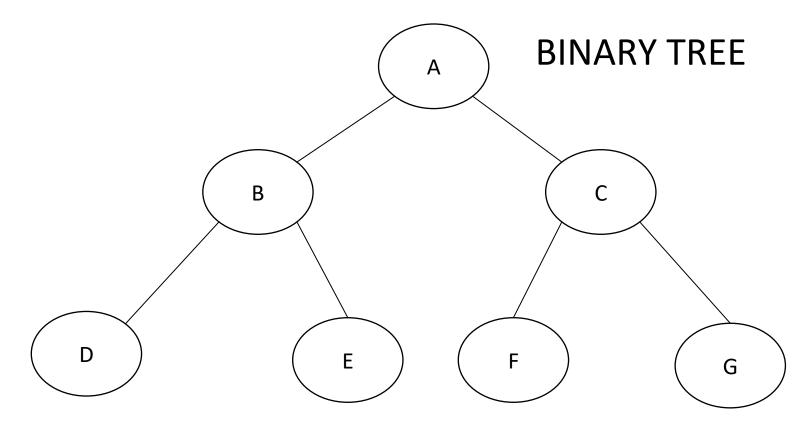

Just pluck the leftmost leaf nodes
One by one.

Post-Order TraversalDE BFG CA

#### **Level Order Traversal**

Level Order traversal of a tree is the breadth first traversal of a tree which points all the nodes of a tree level by level

Level Order Traversal: A B C D E F G
